# SUMMARY

This volume describes the mechanical construction and layout of the Ferranti Pegasus Computer and treats in detail those parts of the machine that are not made up from standard plug-in-packages - the monitor, input and output equipment, power supplies and refrigeration equipment. The drum-storage and time-standardisation systems are explained; but the reader is referred to Volume 5 for a detailed description of the packages used. Separate handbooks are available on the input and output units: the description given in this volume is of the application of these units to the standard Pegasus installation.

The diagrams relevant to this volume are contained in Volume 3a.

Second issue October 1959
